

Statement – Packaging Configuration, QC Verification & In-Use Shelf Life

Following our internal review of batch 24H26-H500264128, we confirm that the 5L Bag-in-Box (BiB) units were packed according to our standard approved packaging configuration and internal palletization procedures prior to dispatch.

Each BiB unit is assembled with a complete inner liner bag as a standard packaging component. During production and packaging operations, in-process and final quality control checks are performed to verify the integrity and completeness of the packaging configuration before release of the batch.

The pallet was prepared at our facility using stretch film, cardboard protection and corner protectors prior to pickup by the transportation company. Based on our available records and QC release documentation, the goods left our warehouse in compliant and acceptable condition.

Regarding in-use stability after first opening, the product should be stored at 2–8°C and protected from contamination during handling. Based on the nature of the product and intended use, an in-use shelf life of 6 months after first opening may be applied when stored under the recommended conditions.

This statement is issued in good faith based on the available production, packaging and quality documentation related to the batch concerned.
